

Your product. A new way to Earn.

Give stablecoin balances a useful place inside the experience your customers already trust. Thesauros connects the customer account, vault infrastructure and operating data needed to build an embedded Earn product.

Make it part of your product

For a neobank, Earn can become a pocket alongside an everyday balance. For a wallet, it can make yield discoverable where the customer already holds assets. For a platform, it can add a consistent account and reporting experience around an agreed vault integration.

You define the entry point, customer journey and brand. Together, we map eligible balances, the signing flow, attribution and the account information your application needs.

One integration, clear responsibilities

Your product	Thesauros infrastructure
Customer experience and account relationship	Vault and provider integration
Wallet authorization and transaction presentation	Allocation and contract operating controls
Backend identity and customer support	Partner attribution, activity and reporting APIs
Product economics and launch decisions	Technical review, integration guidance and operating data

The Partner API supports attribution and reporting. Customer settlement uses the confirmed wallet and contract flow. The sandbox lets your team prototype the account journey before that integration is complete.

Understand the business case

Start with eligible balances and expected participation. Model the yield, protocol fee and partner share separately. Partner revenue in the API is a share of protocol fees, not a percentage of customer principal. Agree the commercial terms for your pilot with the team.

A practical path to launch

1. **Define the product.** Choose the customer, asset, entry point and intended balance behavior.
2. **Build the flow.** Prototype Earn, connect attribution and reporting, and validate wallet settlement against the deployment pack.
3. **Operate with confidence.** Review controls and audit scope; agree reconciliation, incident ownership and pilot success measures.

Start with your customer flow

Bring your balance profile and product priorities. We will work through the Earn experience, integration and pilot with your product, engineering and operations teams.
